Inexact PPM, Huber-loss fitting: work and time over the s sweep at $\sigma = 0.1$
measured (median; whiskers 10–90%)
Theorem 4.3 bound with the observed K_δ (median)
gradient descent, step $1/L$ (no outer iterations)
near-exact PPM (inner tol 10^{-12})
recommended $s^\star$ (Lemma 4.2) $= s^\star_{\mathrm{ex}}$ (Remark 4.4)
Outer iterations
Accepted updates K_δ
$s^\star = s^\star_{\mathrm{ex}}$
near-exact
Inner work against its bound
Total inner iterations
near-exact
$s^\star = s^\star_{\mathrm{ex}}$
gradient descent
Checks of the stopping tests
Total checks
near-exact
$s^\star = s^\star_{\mathrm{ex}}$
gradient descent
Wall-clock time
Algorithm wall-clock (s)
near-exact
$s^\star = s^\star_{\mathrm{ex}}$
gradient descent
Stride s
