
Huber-loss fitting in two dimensions ($m = 7$, seed 6): σ sweep at $s = 1$, $\delta = 10^{-9}$
$\sigma = 0.01$ ($K_\delta = 22$, 321 gradient evaluations)
$\sigma = 0.05$ ($K_\delta = 21$, 230 gradient evaluations)
$\sigma = 0.2$ ($K_\delta = 20$, 180 gradient evaluations)
$\sigma = 0.5$ ($K_\delta = 18$, 159 gradient evaluations)
$\sigma = 0.9$ ($K_\delta = 47$, 142 gradient evaluations)
$\sigma = 1$ ($K_\delta = 54$, 140 gradient evaluations)
near-exact PPM, inner tol 10^{-12} ($K_\delta = 22$, 1571 gradient evaluations)
$\sigma^\star = 0.074$, Prop. 5.1 ($K_\delta = 21$, 219 gradient evaluations)
gradient descent, step $1/L$ (131 gradient evaluations)
Against outer iterations
Against inner work
Suboptimality $|f(x_k) - f^\star|$
Stationarity $\|\nabla f(x_k)\|$
Outer iteration k
Cumulative gradient evaluations
