
Huber-loss fitting in two dimensions ($m = 8$, seed 9): σ sweep at $b = 1$, $\delta = 10^{-9}$
$\sigma = 0.01$ ($K_\delta = 81$, 1677 gradient steps)
$\sigma = 0.05$ ($K_\delta = 80$, 1189 gradient steps)
$\sigma = 0.2$ ($K_\delta = 79$, 779 gradient steps)
$\sigma = 0.5$ ($K_\delta = 75$, 522 gradient steps)
$\sigma = 0.9$ ($K_\delta = 72$, 433 gradient steps)
$\sigma = 1$ ($K_\delta = 72$, 431 gradient steps)
near-exact PPM, inner tol 10^{-12} ($K_\delta = 81$, 6100 gradient steps)
$\sigma^\star = 0.074$, Prop. 5.1 ($K_\delta = 80$, 1026 gradient steps)
gradient descent, step $1/L$ (711 gradient steps)
Against outer iterations
Against inner work
Suboptimality $|f(x_k) - f^\star|$
Stationarity $\|\nabla f(x_k)\|$
Outer iteration k
Cumulative inner iterations (gradient steps)
